| Assignment 1 | 2  | Accept username through HTML form and display it                    | 6     |
| Assignment 1 | 3  | Get the client IP address                                           | 7     |
| Assignment 1 | 4  | Simple PHP browser detection script                                 | 7     |
| Assignment 1 | 5  | Get the current file name                                           | 8     |
| Assignment 1 | 6  | Return components of the given URL                                  | 8     |
| Assignment 1 | 7  | Check whether the page is called from HTTPS or HTTP                 | 9     |
| Assignment 1 | 8  | Redirect a user to a different page                                 | 10    |
| Assignment 1 | 9  | Check whether an email is valid                                     | 11    |
| Assignment 1 | 10 | Display strings and values within a table                           | 11    |
| Assignment 1 | 11 | Get information about the operating system PHP is running on        | 13    |
| Assignment 1 | 12 | Get the last occurred error                                         | 13    |
| Assignment 1 | 13 | Check whether a number is even or odd using user input              | 14    |
| Assignment 1 | 14 | Calculate circumference and area of a circle                        | 15-16 |
| Assignment 1 | 15 | Calculate the grade/class from student marks                        | 16-17 |
| Assignment 1 | 16 | Count a search word in a user-input paragraph                       | 18    |
| Assignment 1 | 17 | User registration with validation                                   | 19-20 |
| Assignment 2 | 1  | Check whether three integers are in the range 20..50                | 22    |
| Assignment 2 | 2  | Find which number is nearest to 100                                 | 23    |
| Assignment 2 | 3  | Check whether two integers are in the ranges 40..50 or 50..60       | 24    |
| Assignment 2 | 4  | Convert the last 3 characters of a string to uppercase              | 25    |
| Assignment 2 | 5  | Count the string "aa" in a given string                             | 26    |
| Assignment 2 | 6  | Check whether a specified number is present in an array             | 27    |
| Assignment 2 | 7  | Check whether a string starts with "F" or ends with "B" (Fizz/Buzz) | 28    |
| Assignment 2 | 8  | Insert a given string into the middle of another 4-character string | 30    |
| Assignment 2 | 9  | Create long + short + long string from two given strings            | 31    |
| Assignment 2 | 10 | Rotate a 4-element array in the left direction                      | 32    |

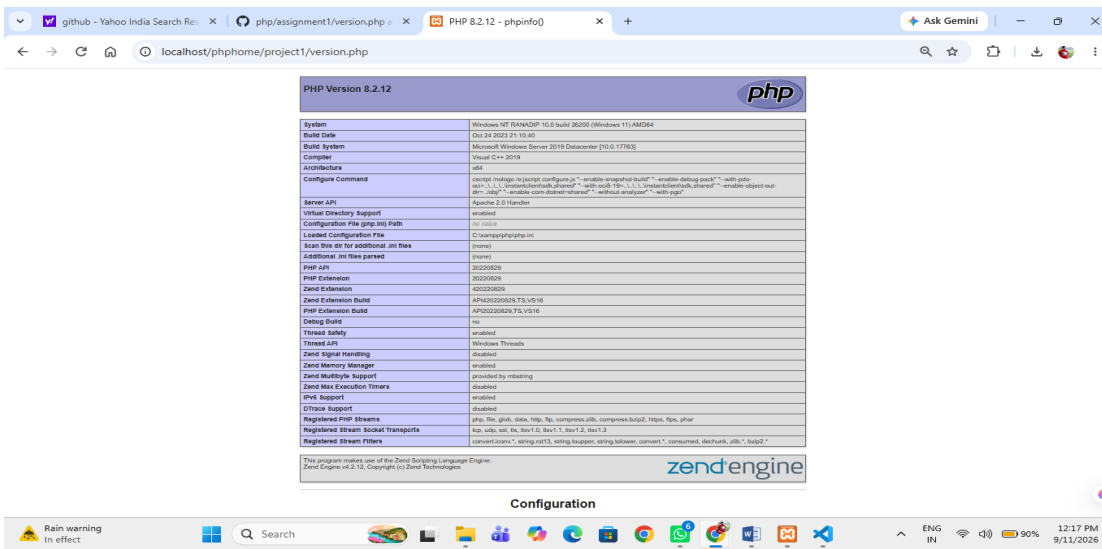

# Assignment – 1

## PHP With MYSQL

### 1. Get PHP version and configuration information

```
<?php  
phpinfo();  
?>
```

Output:

| PHP Version 8.2.12                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 2. Accept username through HTML form and display it

```
<!DOCTYPE html>
<html>
<body>
<form method="post">
    Enter Name: <input type="text" name="username" required>
    <input type="submit" value="Submit">
</form>

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
    echo "Your name is: " . htmlspecialchars($_POST["username"]);
}
?>
</body>
</html>
```

### Output:

← → ↻ 🏠 ⓘ localhost/phphome/project1/html.php

Enter Name:  Submit

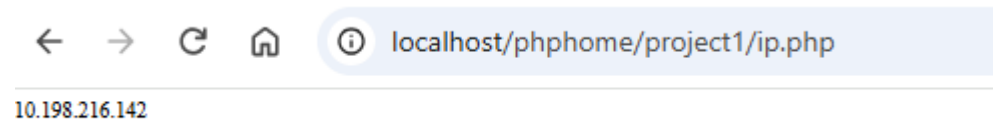

Your name is: ranadip paul

### 3. Get the client IP address

```
<?php
echo gethostbyname(gethostbyname());

?>
```

**Output:**

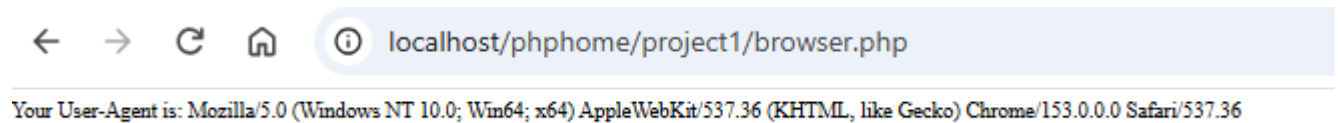

### 4. Simple PHP browser detection script

```
<?php
$userAgent = $_SERVER['HTTP_USER_AGENT'];
echo "Your User-Agent is: " . htmlspecialchars($userAgent);

?>
```

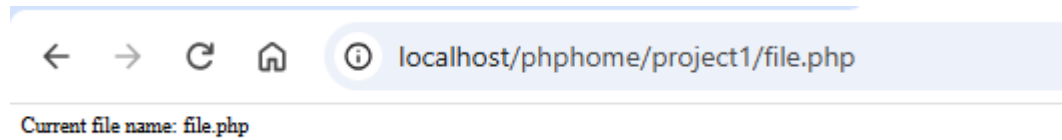

**Output:**

## 5. Get the current file name

```
<?php
echo "Current file name: " . basename($_SERVER['PHP_SELF']);
?>
```

### Output:

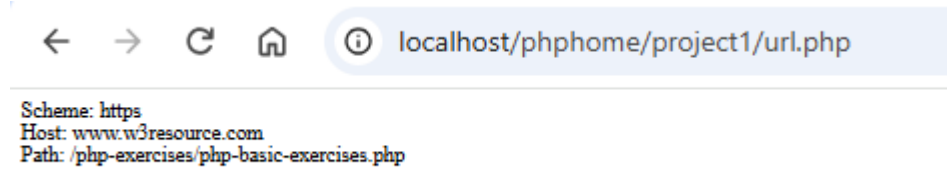

## 6. Return components of the given URL

```
<?php
$url = 'https://www.w3resource.com/php-exercises/php-basic-exercises.php';
$parts = parse_url($url);

echo "Scheme: " . $parts['scheme'] . "<br>";
echo "Host: " . $parts['host'] . "<br>";
```

```
echo "Path: " . $parts['path'];  
?>
```

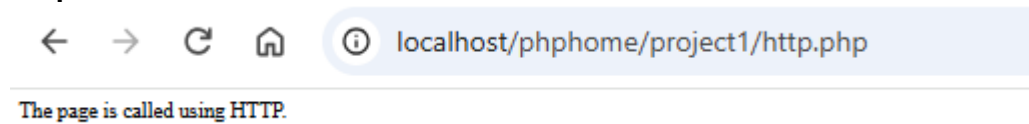

**Output:**

## 7. Check whether the page is called from HTTPS or HTTP

```
<?php  
if (isset($_SERVER['HTTPS']) && $_SERVER['HTTPS'] !== 'off') {  
    echo "The page is called using HTTPS.";  
} else {  
    echo "The page is called using HTTP.";  
}  
?>
```

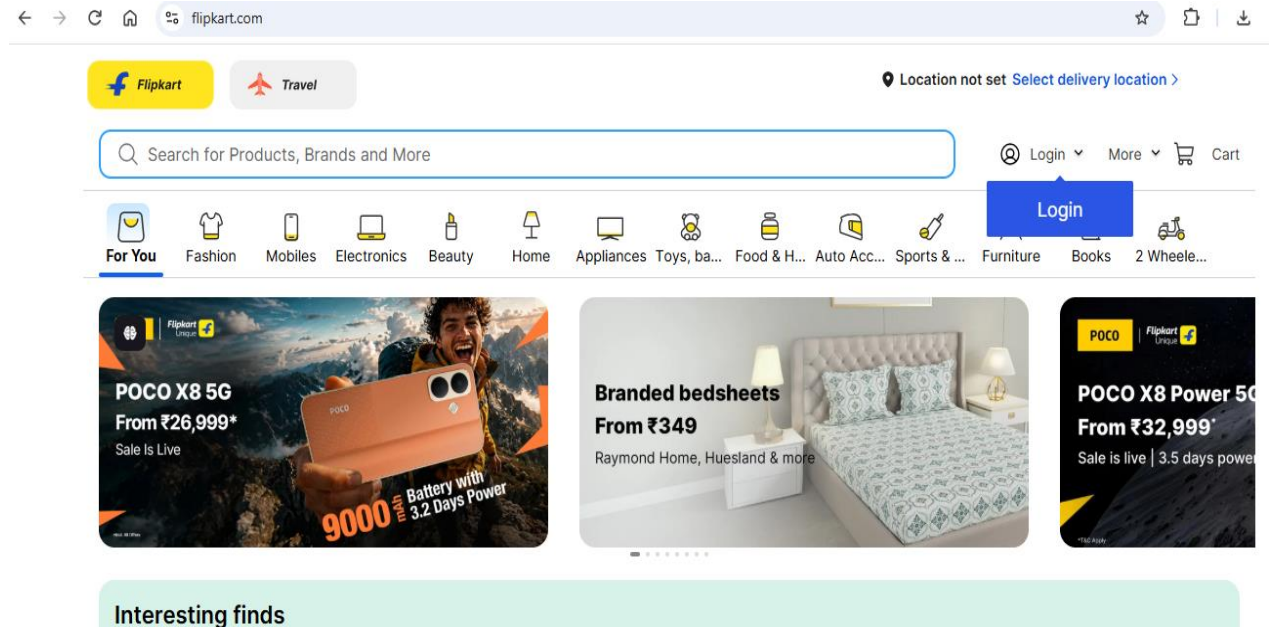

**Output:**

## 8. Redirect a user to a different page

```
<?php
header("Location:
https://www.flipkart.com/"); exit;
?>
```

### Output:

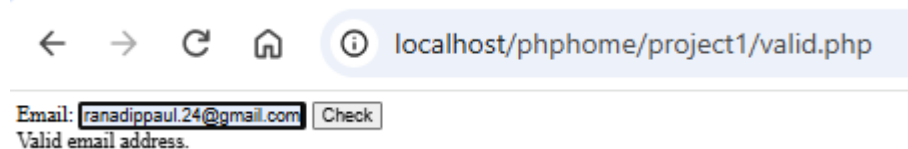

## 9. Check whether an email is valid

```
<!DOCTYPE html>
<html>
<body>
<form method="post">
    Email: <input type="text" name="email" required>
    <input type="submit" value="Check">
</form>

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
    $email = trim($_POST["email"]);

    if (filter_var($email, FILTER_VALIDATE_EMAIL)) {
        echo "Valid email address.";
    } else {
        echo "Invalid email address.";
    }
}
?>
</body>
</html>
```

### Output:

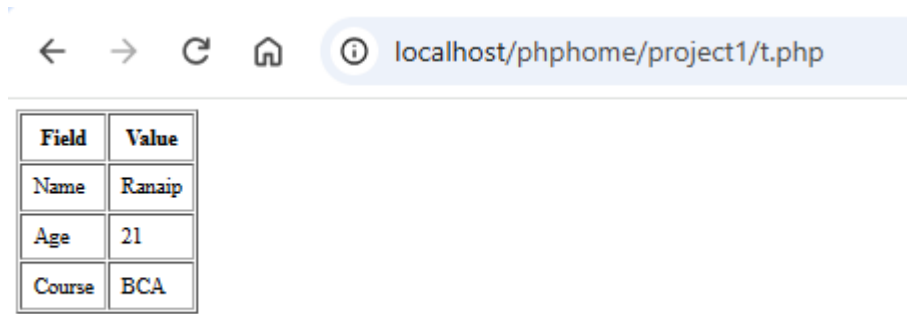

## 10. Display strings and values within a table

```
<?php
$name = "Shankho";
$age = 21;
$course = "BCA";

echo "<table border='1' cellpadding='8'>";
echo "<tr><th>Field</th><th>Value</th></tr>";
echo "<tr><td>Name</td><td>$name</td></tr>";
echo "<tr><td>Age</td><td>$age</td></tr>";
echo "<tr><td>Course</td><td>$course</td></tr>";
echo "</table>";
?>
```

**Output:**

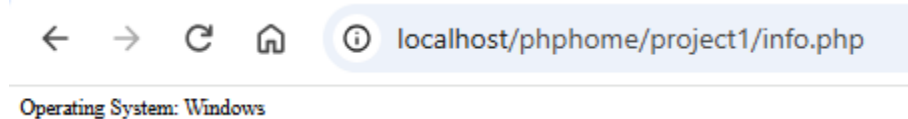

A screenshot of a web browser window. The address bar shows the URL 'localhost/phphome/project1/t.php'. Below the address bar, there is a table with two columns: 'Field' and 'Value'. The table contains three rows of data: 'Name' with value 'Ranaip', 'Age' with value '21', and 'Course' with value 'BCA'.

| Field  | Value  |
|--------|--------|
| Name   | Ranaip |
| Age    | 21     |
| Course | BCA    |

## 11. Get information about the operating system PHP is running on

```
<?php
echo "Operating System: " . PHP_OS_FAMILY;
?>
```

### Output:

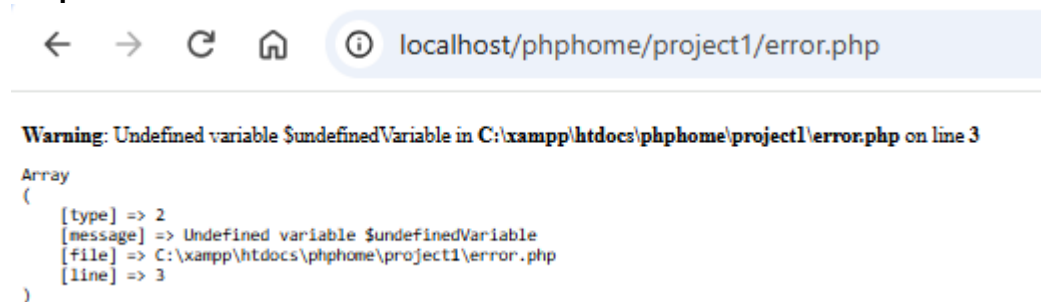

## 12. Get the last occurred error

```
<?php
// Example error
echo $undefinedVariable;

$error = error_get_last();

if ($error !== null) {
    echo "<pre>";
    print_r($error);
    echo "</pre>";
} else {
    echo "No error has occurred.";
}
?>
```

### Output:

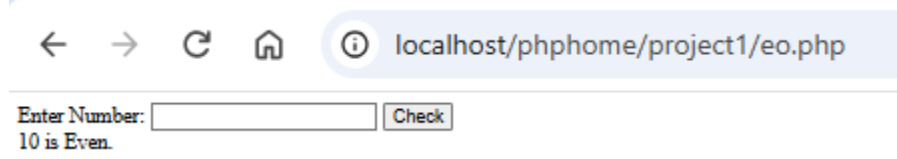

### 13. Check whether a number is even or odd using user input

```
<!DOCTYPE html>
<html>
<body>
<form method="post">
    Enter Number: <input type="number" name="number" required>
    <input type="submit" value="Check">
</form>

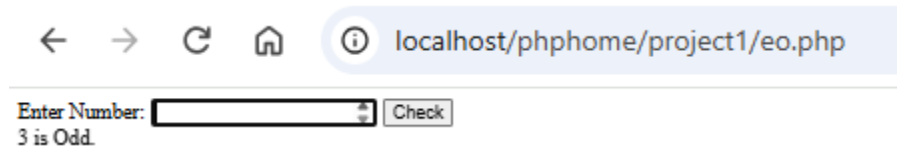

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
    $number = (int)$_POST["number"];

    if ($number % 2 == 0) {
        echo "$number is Even.";
    } else {
        echo "$number is Odd.";
    }
}
?>
</body>
</html>
```

#### Output:

The screenshot shows a web browser window with the address bar displaying 'localhost/phphome/project1/eo.php'. Below the address bar, there is a form with the text 'Enter Number:' followed by a text input field containing the number '10'. To the right of the input field is a button labeled 'Check'. Below the input field, the output of the script is displayed: '10 is Even.'

The screenshot shows the same web browser window with the address bar displaying 'localhost/phphome/project1/eo.php'. Below the address bar, there is a form with the text 'Enter Number:' followed by a text input field containing the number '3'. To the right of the input field is a button labeled 'Check'. Below the input field, the output of the script is displayed: '3 is Odd.'

## 14. Calculate circumference and area of a circle

```
<!DOCTYPE html>
<html>
<body>
<form method="post">
    Enter Radius: <input type="number" name="radius" step="any" min="0" required>
    <input type="submit" value="Calculate">
</form>

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
    $radius = (float)$_POST["radius"];

    $circumference = 2 * pi() * $radius;
    $area = pi() * $radius * $radius;

    echo "Circumference: " . $circumference . "<br>";
    echo "Area: " . $area;
```

```

}
?>
</body>
</html>

```

## Output:

## 15. Calculate the grade/class from student marks

```

<!DOCTYPE html>
<html>
<body>
<form method="post">
    Enter Marks: <input type="number" name="marks" min="0" max="1000" required>
    <input type="submit" value="Calculate">
</form>

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
    $marks = (int)$_POST["marks"];

    if ($marks > 800 && $marks <= 1000) {
        echo "Print";
    } elseif ($marks > 600 && $marks <= 800) {
        echo "Class II";
    } elseif ($marks > 400 && $marks <= 600) {
        echo "Class III";
    } elseif ($marks >= 0 && $marks <= 400) {
        echo "Fail";
    } else {
        echo "Invalid marks.";
    }
}
}
?>
</body>
</html>

```

## Output:

← → ↻ 🏠 ⓘ localhost/phphome/project1/grade.php

Enter Marks:  Calculate  
Class II

← → ↻ 🏠 ⓘ localhost/phphome/project1/grade.php

Enter Marks:  Calculate  
Fail

← → ↻ 🏠 ⓘ localhost/phphome/project1/grade.php

Enter Marks:  Calculate  
Class III

## 16. Count a search word in a user-input paragraph

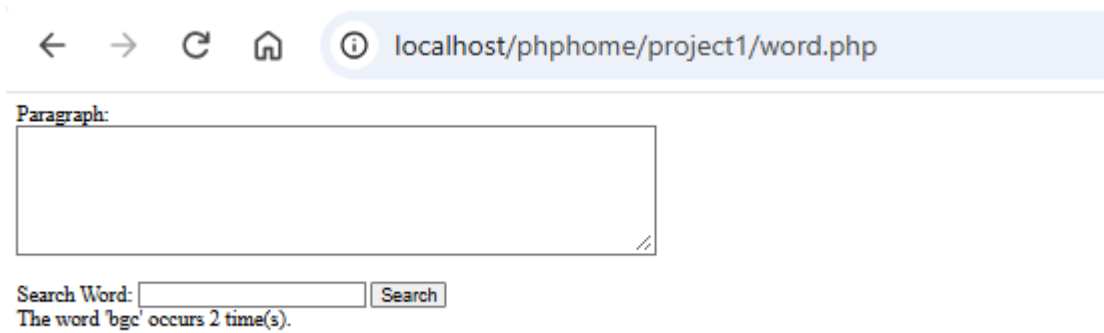

```
<!DOCTYPE html>
<html>
<body>
<form method="post">
  <label>Paragraph:</label><br>
  <textarea name="paragraph" rows="6" cols="60" required></textarea><br><br>

  <label>Search Word:</label>
  <input type="text" name="word" required>
  <input type="submit" value="Search">
</form>

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
  $paragraph = $_POST["paragraph"];
  $word = trim($_POST["word"]);

  if ($word === "") {
    echo "Please enter a search word.";
  } else {
    $count = substr_count(strtolower($paragraph), strtolower($word));
    echo "The word '" . htmlspecialchars($word) . "' occurs " . $count . "
time(s).";
  }
}
?>
</body>
</html>
```

## Output:

← → ↻ 🏠 ⓘ localhost/phphome/project1/word.php

Paragraph:

Search Word:  Search

The word 'bgc' occurs 2 time(s).

## 17. User registration with validation

```
<!DOCTYPE html>
<html>
<body>
<h2>User Registration</h2>

<form method="post">
```

```

Full Name:
<input type="text" name="fullname" required><br><br>

Date of Birth:
<input type="date" name="dob" required><br><br>

Email ID:
<input type="email" name="email" required><br><br>

Mobile:
<input type="text" name="mobile" maxlength="10" required><br><br>

<label>
    <input type="checkbox" name="terms">
    I agree to the terms and conditions
</label><br><br>

    <input type="submit" value="Register">
</form>

<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
    $fullname = trim($_POST["fullname"]);
    $dob = $_POST["dob"];
    $email = trim($_POST["email"]);
    $mobile = trim($_POST["mobile"]);
    $terms = isset($_POST["terms"]);

    $errors = [];
    if (count(preg_split('/\s+/', $fullname)) < 2) {
        $errors[] = "Full name must contain at least two words.";
    }
    if ($dob === "") {
        $errors[] = "Date of birth is required.";
    } else {
        try {
            $birthDate = new DateTime($dob);
            $today = new DateTime();
            $age = $today->diff($birthDate)->y;

            if ($birthDate > $today || $age < 18) {
                $errors[] = "User must be at least 18 years old.";
            }
        } catch (Exception $e) {
            $errors[] = "Invalid date of birth.";
        }
    }
    if (!filter_var($email, FILTER_VALIDATE_EMAIL)) {
        $errors[] = "Please enter a valid email address.";
    }
    if (!preg_match('/^\d{10}$/', $mobile)) {
        $errors[] = "Mobile number must be exactly 10 digits.";
    }
}

```

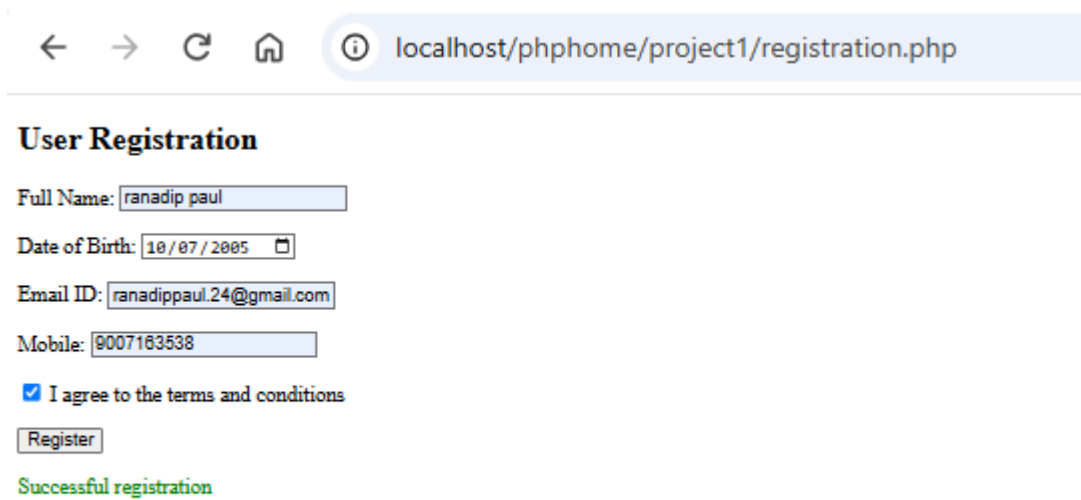

```

if (!$terms) {
    $errors[] = "You must agree to the terms and conditions.";
}

if (empty($errors)) {
    echo "<p style='color:green;'>Successful registration</p>";
} else {
    echo "<ul style='color:red;'>"; foreach
    ($errors as $error) {
        echo "<li>" . htmlspecialchars($error) . "</li>";
    }
    echo "</ul>";
}
}
?>
</body>
</html>

```

## Output:

The screenshot shows a web browser window with the address bar displaying 'localhost/phphome/project1/registration.php'. The page title is 'User Registration'. The form contains the following fields and values:

- Full Name: ranadip paul
- Date of Birth: 18/07/2005
- Email ID: ranadippaul.24@gmail.com
- Mobile: 9007163538
- Checkbox: ☒ I agree to the terms and conditions
- Register button

Below the form, the text 'Successful registration' is displayed in green.

# Assignment – 2

## PHP With MYSQL

### Question 18

Write a PHP program to check whether three given integer values are in the range 20..50 inclusive. Return true if 1 or more of them are in the said range otherwise false.

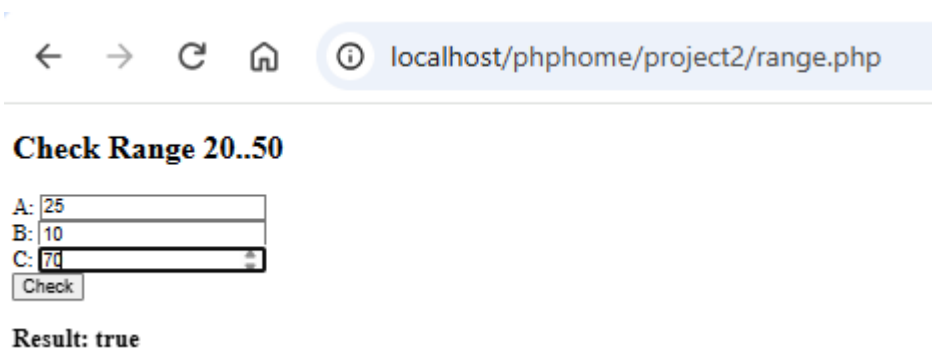

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $a = (int)$_POST['a'];
    $b = (int)$_POST['b'];
    $c = (int)$_POST['c'];

    if (($a >= 20 && $a <= 50) || ($b >= 20 && $b <= 50) || ($c >= 20 && $c <= 50)) {
        $result = "true";
    } else {
        $result = "false";
    }
}
?>

<h2>Check Range 20..50</h2>
<form method="post">
A: <input type="number" name="a" value="25" required><br>
B: <input type="number" name="b" value="10" required><br>
C: <input type="number" name="c" value="70" required><br>
<button>Check</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output :

← → ↺ 🏠 ⓘ localhost/phphome/project2/range.php

### Check Range 20..50

A:

B:

C:

**Result: true**

## Question 19

Write a PHP program to check which number nearest to the value 100 among two given integers. Return 0 if the two numbers are equal.

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $a = (int)$_POST['a'];
    $b = (int)$_POST['b'];

    if ($a == $b) {
        $result = 0;
    } elseif (abs(100 - $a) < abs(100 - $b)) {
        $result = $a;
    } else {
        $result = $b;
    }
}
?>

<h2>Nearest to 100</h2>
<form method="post">
First: <input type="number" name="a" value="90" required><br><br>
Second: <input type="number" name="b" value="80" required><br><br>
<button>Check</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output

localhost/phphome/project2/range1.php

---

## Nearest to 100

First:

Second:

**Result: 98**

## Question 20

Write a PHP program to check whether two given integers are in the range 40..50 inclusive, or they are both in the range 50..60 inclusive.

### Code

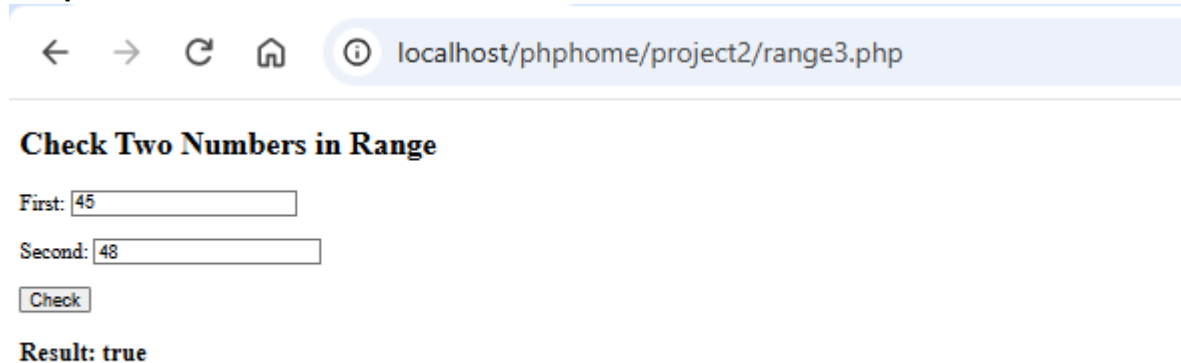

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $a = (int)$_POST['a'];
    $b = (int)$_POST['b'];

    $range1 = ($a >= 40 && $a <= 50 && $b >= 40 && $b <= 50);
    $range2 = ($a >= 50 && $a <= 60 && $b >= 50 && $b <= 60);

    $result = ($range1 || $range2) ? "true" : "false";
}
?>

<h2>Check Two Numbers in Range</h2>
<form method="post">
First: <input type="number" name="a" value="45" required><br><br>
Second: <input type="number" name="b" value="48" required><br><br>
<button>Check</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output:

← → ↻ 🏠 ⓘ localhost/phphome/project2/range3.php

---

### Check Two Numbers in Range

First:

Second:

**Result: true**

## Question 21

Write a PHP program to convert the last 3 characters of a given string in upper case. If the length of the string has less than 3 then uppercase all the characters.

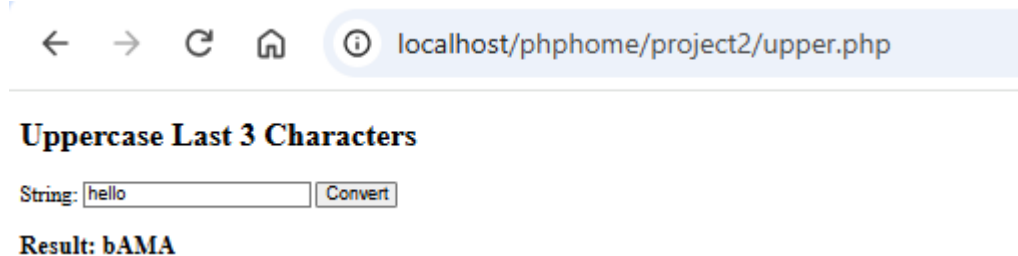

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $s = $_POST['s'];
    $length = strlen($s);

    if ($length < 3) {
        $result = strtoupper($s);
    } else {
        $result = substr($s, 0, $length - 3) . strtoupper(substr($s, -3));
    }
}
?>

<h2>Uppercase Last 3 Characters</h2>
<form method="post">
String: <input type="text" name="s" value="hello" required>
<button>Convert</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output:

← → ↻ 🏠 ⓘ localhost/phphome/project2/upper.php

---

## Uppercase Last 3 Characters

String:

**Result: bAMA**

## Question 22

Write a PHP program to count the string "aa" in a given string and assume "aaa" contains two "aa".

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $s = $_POST['s'];
    $result = 0;

    for ($i = 0; $i < strlen($s) - 1; $i++) {
        if (substr($s, $i, 2) === "aa") {
            $result++;
        }
    }
}
?>

<h2>Count "aa" in String</h2>
<form method="post">
String: <input type="text" name="s" value="aaa" required>
<button>Count</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output:

 localhost/phphome/project2/aaa.php

---

### Count "aa" in String

String:

**Result: 2**

## Question 23

Write a PHP program to check a specified number is present in a given array of integers.

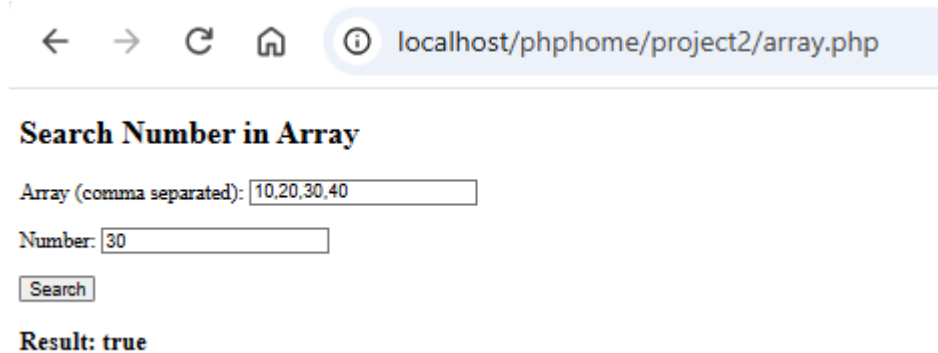

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $arr = array_map('intval', explode(',', $_POST['arr']));
    $number = (int)$_POST['number'];

    $result = in_array($number, $arr) ? "true" : "false";
}
?>

<h2>Search Number in Array</h2>
<form method="post">
Array (comma separated): <input type="text" name="arr" value="10,20,30,40" required><br><br>
Number: <input type="number" name="number" value="30" required><br><br>
<button>Search</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output:

← → ↻ 🏠 ⓘ localhost/phphome/project2/array.php

---

### Search Number in Array

Array (comma separated):

Number:

**Result: true**

## Question 24

Write a PHP program to check whether a given string starts with "F" or ends with "B". If the string starts with "F" return "Fizz" and return "Buzz" if it ends with "B". If the string starts with "F" and ends with "B" return "FizzBuzz". In other cases return the original string.

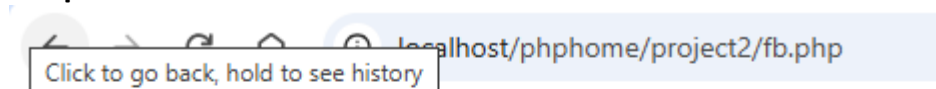

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $s = $_POST['s'];
    $startsF = strtoupper(substr($s, 0, 1)) === "F";
    $endsB = strtoupper(substr($s, -1)) === "B";

    if ($startsF && $endsB) {
        $result = "FizzBuzz";
    } elseif ($startsF) {
        $result = "Fizz";
    } elseif ($endsB) {
        $result = "Buzz";
    } else {
        $result = $s;
    }
}
?>

<h2>Fizz / Buzz</h2>
<form method="post">
String: <input type="text" name="s" value="FAB" required>
<button>Check</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

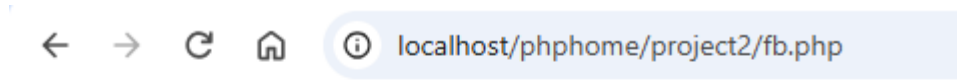

### Output:

#### Fizz / Buzz

String:

Result: FizzBuzz

#### Fizz / Buzz

String:

Result: Buzz

**Fizz / Buzz**

String:

**Result: Fizz**

## Question 25

Write a PHP program to insert a given string into middle of the another given string of length 4.

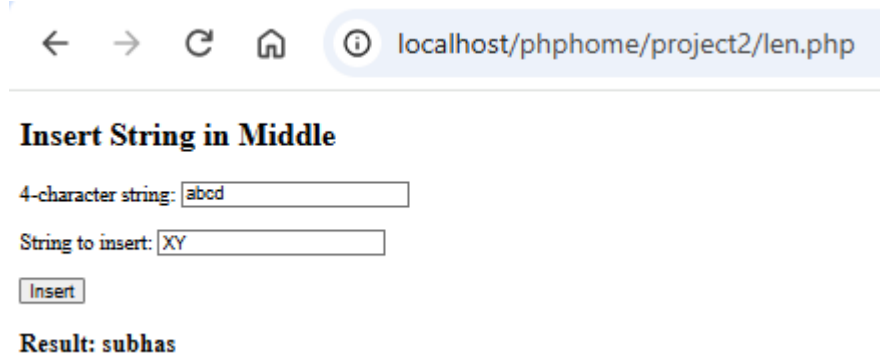

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $s = $_POST['s'];
    $insert = $_POST['insert'];

    $result = substr($s, 0, 2) . $insert . substr($s, 2);
}
?>

<h2>Insert String in Middle</h2>
<form method="post">
4-character string: <input type="text" name="s" value="abcd" maxlength="4" required><br><br>
String to insert: <input type="text" name="insert" value="XY" required><br><br>
<button>Insert</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output:

← → ↻ 🏠 ⓘ localhost/phphome/project2/len.php

---

### Insert String in Middle

4-character string:

String to insert:

**Result: subhas**

## Question 26

Write a PHP program to create a new string from two given string one is shorter and another is longer. The format of the new string will be long string + short string + long string.

### Code

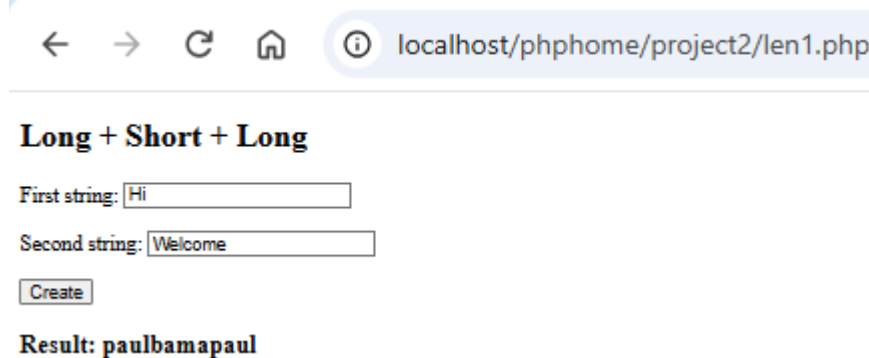

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $a = $_POST['a'];
    $b = $_POST['b'];

    if (strlen($a) >= strlen($b)) {
        $long = $a;
        $short = $b;
    } else {
        $long = $b;
        $short = $a;
    }

    $result = $long . $short . $long;
}
?>

<h2>Long + Short + Long</h2>
<form method="post">
First string: <input type="text" name="a" value="Hi" required><br><br>
Second string: <input type="text" name="b" value="Welcome" required><br><br>
<button>Create</button>
</form>
<?php if ($result !== null) echo "<h3>Result: $result</h3>"; ?>
</body>
</html>
```

### Output:

← → ↺ 🏠 ⓘ localhost/phphome/project2/len1.php

---

## Long + Short + Long

First string:

Second string:

**Result: paulbamapaul**

## Question 27

Write a PHP program to rotate the elements of a given array of integers (length 4 ) in left direction and return the new array.

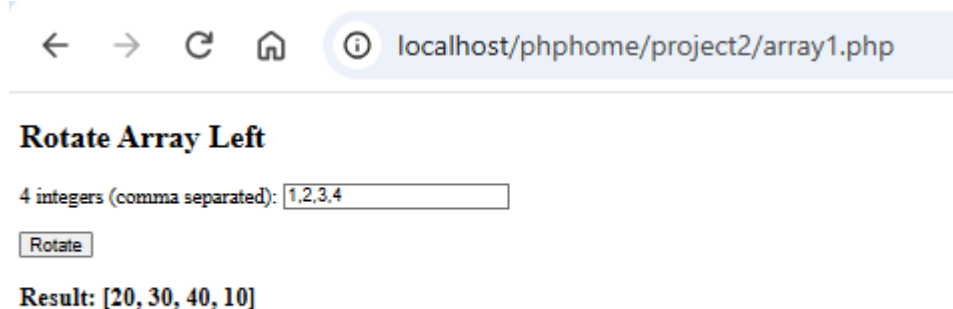

### Code

```
<!DOCTYPE html>
<html>
<body>
<?php
$result = null;
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $arr = array_map('trim', explode(',', $_POST['arr']));
    $first = array_shift($arr);
    $arr[] = $first;

    $result = implode(' ', $arr);
}
?>

<h2>Rotate Array Left</h2>
<form method="post">
4 integers (comma separated): <input type="text" name="arr" value="1,2,3,4" required><br><br>
<button>Rotate</button>
</form>
<?php if ($result !== null) echo "<h3>Result: [$result]</h3>"; ?>
</body>
</html>
```

### Output:

← → ↻ 🏠 ⓘ localhost/phphome/project2/array1.php

---

### Rotate Array Left

4 integers (comma separated):

**Result: [20, 30, 40, 10]**
